1 Formalization

1.1 Syntax

$$f \in \text{TransformerNames} \qquad\qquad t \in \text{TypeNames}$$
$$a, x, y, z \in \text{Identifiers} \qquad\qquad \alpha, \beta \in \text{TypeVariables}$$

$\mathcal{Q}, \mathcal{R}, \mathcal{S}$	::=	`!` | `any` | `nonempty` | `empty` | `every`	(type quantities)
M	::=	`fungible` | `unique` | `immutable` | `consumable` | `asset`	(type declaration modifiers)
T	::=	`bool` | `nat` | α | $t[\overline{T}]$ | `table`$(\overline{x})\,\{\overline{x:\tau}\}$	(base types)
τ, σ, π	::=	$\mathcal{Q}\,T$	(types)
T_V	::=	α `is` $\overline{M}$	(type variable declaration)
$\mathcal{L}, \mathcal{K}$	::=	`true` | `false` | n	
	|	x | $\mathcal{L}.x$ | `var` $x:T$ | $[\overline{\mathcal{L}}]$ | $\overline{\{x:\tau \mapsto \mathcal{L}\}}$	
	|	`demote`$(\mathcal{L})$ | `copy`$(\mathcal{L})$	
	|	$\mathcal{L}[\mathcal{L}]$ | $\mathcal{L}[\mathcal{Q}$ s.t. $f[\overline{T}](\overline{L})]$ | `consume`	
`Decl`	::=	`transformer` $f[\overline{T_V}](\overline{x:\tau}) \to x:\tau\,\{\overline{\text{Stmt}}\}$	(transformers)
	|	`type` $t[\overline{T_V}]$ `is` $\overline{M}\,T$	(type decl.)
`Trfm`	::=	`new` $t[\overline{T}](\overline{\mathcal{L}})$ | $f[\overline{T}](\overline{\mathcal{L}})$	(transformer calls)
`Stmt`	::=	$\mathcal{L} \to \mathcal{L}$ | $\mathcal{L} \to \text{Trfm} \to \mathcal{L}$	(flows)
	|	`try` $\{\overline{\text{Stmt}}\}$ `catch` $\{\overline{\text{Stmt}}\}$	(try-catch)
`Prog`	::=	$\overline{\text{Decl}};\text{Stmt}$	(programs)

1.2 Statics

Define $\# : \mathbb{N} \cup \{\infty\} \to \mathcal{Q}$ so that $\#(n)$ is the best approximation by type quantity of n, i.e.,

$$
\#(n) = \begin{cases}
\texttt{empty} & \text{if } n = 0 \\
\texttt{!} & \text{if } n = 1 \\
\texttt{nonempty} & \text{if } n > 1 \\
\texttt{every} & \text{if } n = \infty
\end{cases}
$$

$\boxed{\Gamma \vdash \mathcal{L} : \tau \dashv \Delta}$ **Locator Typing**

$$\frac{b \in \{\texttt{true}, \texttt{false}\}}{\Gamma \vdash b : \texttt{! bool} \dashv \Gamma}\ \text{Bool} \qquad\qquad \frac{}{\Gamma \vdash n : \#(n)\ \texttt{nat} \dashv \Gamma}\ \text{Nat}$$

[The idea is that both `demote`$(\mathcal{L})$ and `copy`$(\mathcal{L})$ give a demoted value, but `demote`$(\mathcal{L})$ gives a read-only value (so no copy needs to happen), whereas copy will actually copy all the data. The results below intentionally throw out the environment Δ, because we don't want to actually consume whatever references we used to get $\mathcal{L} : \tau$.]

$$\frac{\Gamma \vdash \mathcal{L} : \tau \dashv \Delta}{\Gamma \vdash \mathbf{demote}(\mathcal{L}) : \text{demote}(\tau) \dashv \Gamma}\ \text{Demote} \qquad\qquad \frac{\Gamma \vdash \mathcal{L} : \tau \dashv \Delta}{\Gamma \vdash \mathbf{copy}(\mathcal{L}) : \text{demote}(\tau) \dashv \Gamma}\ \text{Copy}$$

[NOTE: It is important that we flow an empty list in the Flow-Transformer-Done rule, otherwise we may fail to allocate a variable as expected.]

$$\frac{\ell \notin \text{dom}(\rho) \qquad \texttt{transformer } f(\overline{y : \tau}) \to z : \sigma \; \{ \; \overline{S} \; \} \qquad \mu' = \overline{y \mapsto \mu(x)}, z \mapsto \ell}{\langle \Sigma, f(\overline{x}) \rangle \to \left\langle (\mu', \rho[\ell \mapsto []]), \overline{S} \; \ell \right\rangle} \text{ Call}$$

We introduce a new statement, $\texttt{try}(\Sigma, \overline{S_1}, \overline{S_2})$, to implement the try-catch statement, which keeps track of the environment that we begin execution in so that we can revert to the original environment in the case of a $\texttt{revert}$.

$$\frac{}{\left\langle \Sigma, \texttt{try } \{\overline{S_1}\} \texttt{ catch } \{\overline{S_2}\} \right\rangle \to \left\langle \Sigma, \texttt{try}(\Sigma, \overline{S_1}, \overline{S_2}) \right\rangle} \text{ Try-Start}$$

$$\frac{\left\langle \Sigma, \overline{S_1} \right\rangle \to \left\langle \Sigma'', \overline{S_1'} \right\rangle}{\left\langle \Sigma, \texttt{try}(\Sigma', \overline{S_1}, \overline{S_2}) \right\rangle \to \left\langle \Sigma'', \texttt{try}(\Sigma', \overline{S_1'}, \overline{S_2}) \right\rangle} \text{ Try-Step}$$

$$\frac{}{\left\langle \Sigma, \texttt{try}(\Sigma', \texttt{revert}, \overline{S_2}) \right\rangle \to \left\langle \Sigma', \overline{S_2} \right\rangle} \text{ Try-Revert} \qquad \frac{}{\left\langle \Sigma, \texttt{try}(\Sigma', \cdot, \overline{S_2}) \right\rangle \to \Sigma} \text{ Try-Done}$$

[TODO: Need to be sure to handle uniqueness correctly]

1.4 Auxiliaries

Definition 2. *Define* $\textbf{\textit{Quant}} = \{\texttt{empty}, \texttt{any}, \texttt{!}, \texttt{nonempty}, \texttt{every}\}$, *and call any* $\mathcal{Q} \in \textbf{\textit{Quant}}$ *a type quantity. Define* $\texttt{empty} < \texttt{any} < \texttt{!} < \texttt{nonempty} < \texttt{every}$.

$\boxed{\text{isAsset}(\overline{T_V}, \tau)}$ **Asset Types**

$$\text{isAsset}(\overline{T_V}, \mathcal{Q}\ T) \Leftrightarrow \mathcal{Q} \neq \texttt{empty} \text{ and } (\texttt{asset} \in \text{modifiers}(\overline{T_V}, T) \text{ or}$$
$$(T = \mathcal{C}\ \tau \text{ and } \text{isAsset}(\overline{T_V}, \tau)) \text{ or}$$
$$(T = \{\overline{y : \sigma}\} \text{ and } \exists x : \tau \in \overline{y : \sigma}.\text{isAsset}(\overline{T_V}, \tau)) \text{ or}$$

$\boxed{\tau\ \texttt{consumable}}$ **Consumable Types**

$$(\mathcal{Q}\ T)\ \texttt{consumable} \Leftrightarrow \texttt{consumable} \in \text{modifiers}(T) \text{ or}$$
$$\neg((\mathcal{Q}\ T)\ \texttt{asset}) \text{ or}$$
$$(T = \mathcal{C}\ \tau \text{ and } \tau\ \texttt{consumable}) \text{ or}$$
$$(T = \{\overline{y : \sigma}\} \text{ and } \forall x : \tau \in \overline{y : \sigma}.(\sigma\ \texttt{consumable}))$$

$\mathcal{Q} \oplus \mathcal{R}$ represents the quantity present when flowing $\mathcal{R}$ of something to a storage already containing $\mathcal{Q}$. $\mathcal{Q} \ominus \mathcal{R}$ represents the quantity left over after flowing $\mathcal{R}$ from a storage containing $\mathcal{Q}$.

Definition 3. *Let* $\mathcal{Q}, \mathcal{R} \in \textbf{\textit{Quant}}$. *Define the commutative operator* $\oplus$, *called* combine, *as the unique function* $\textbf{\textit{Quant}}^2 \to \textbf{\textit{Quant}}$ *such that*

$$
\begin{aligned}
\mathcal{Q} \oplus \texttt{empty} &= \mathcal{Q} \\
\mathcal{Q} \oplus \texttt{every} &= \texttt{every} \\
\texttt{nonempty} \oplus \mathcal{R} &= \texttt{nonempty} \quad \textit{if } \texttt{empty} < \mathcal{R} < \texttt{every} \\
\texttt{!} \oplus \mathcal{R} &= \texttt{nonempty} \quad \textit{if } \texttt{empty} < \mathcal{R} < \texttt{every} \\
\texttt{any} \oplus \texttt{any} &= \texttt{any}
\end{aligned}
$$

Define the operator $\ominus$, *called* split, *as the unique function* $\textbf{\textit{Quant}}^2 \to \textbf{\textit{Quant}}$ *such that*

$$
\begin{aligned}
\mathcal{Q} \ominus \texttt{empty} &= \mathcal{Q} \\
\texttt{empty} \ominus \mathcal{R} &= \texttt{empty} \\
\mathcal{Q} \ominus \texttt{every} &= \texttt{empty} \\
\texttt{every} \ominus \mathcal{R} &= \texttt{every} \quad \textit{if } \mathcal{R} < \texttt{every} \\
\texttt{nonempty} - \mathcal{R} &= \texttt{any} \quad \textit{if } \texttt{empty} < \mathcal{R} < \texttt{every} \\
\texttt{!} - \mathcal{R} &= \texttt{empty} \quad \textit{if } \texttt{!} \leq \mathcal{R} \\
\texttt{!} - \texttt{any} &= \texttt{any} \\
\texttt{any} - \mathcal{R} &= \texttt{any} \quad \textit{if } \texttt{empty} < \mathcal{R} < \texttt{every}
\end{aligned}
$$

Note that we write $(\mathcal{Q}\ T) \oplus \mathcal{R}$ to mean $(\mathcal{Q} \oplus \mathcal{R})\ T$ and similarly $(\mathcal{Q}\ T) \ominus \mathcal{R}$ to mean $(\mathcal{Q} \ominus \mathcal{R})\ T$.

Definition 4. *We can consider a type environment* Γ *as a function* IDENTIFIERS $\to$ TYPES$\cup\{\bot\}$ *as follows:*

$$\Gamma(x) = \begin{cases} \tau & \textit{if } x : \tau \in \Gamma \\ \bot & \textit{otherwise} \end{cases}$$

We write $\textbf{\textit{dom}}(\Gamma)$ *to mean* $\{x \in \text{IDENTIFIERS} \mid \Gamma(x) \neq \bot\}$, *and* $\Gamma|_X$ *to mean the environment* $\{x : \tau \in \Gamma \mid x \in X\}$ *(restricting the domain of* Γ*).*

Definition 5. *Let $\mathcal{Q}$ and $\mathcal{R}$ be type quantities, $T_\mathcal{Q}$ and $T_\mathcal{R}$ base types, and Γ and Δ type environments. Define the following orderings, which make types and type environments into join-semilattices. For type quantities, define the partial order $\sqsubseteq$ as the reflexive closure of the strict partial order $\sqsubset$ given by*

$$\mathcal{Q} \sqsubset \mathcal{R} \Leftrightarrow (\mathcal{Q} \neq \textbf{any} \text{ and } \mathcal{R} = \textbf{any}) \text{ or } (\mathcal{Q} \in \{!, \textbf{every}\} \text{ and } \mathcal{R} = \textbf{nonempty})$$

For types, define the partial order $\leq$ by

$$\mathcal{Q}\, T_\mathcal{Q} \leq \mathcal{R}\, T_\mathcal{R} \Leftrightarrow T_\mathcal{Q} = T_\mathcal{R} \text{ and } \mathcal{Q} \sqsubseteq \mathcal{R}$$

For type environments, define the partial order $\leq$ by

$$\Gamma \leq \Delta \Leftrightarrow \forall x. \Gamma(x) \leq \Delta(x)$$

Denote the join of Γ and Δ by $\Gamma \sqcup \Delta$.

$\boxed{\text{elemtype}(T) = \tau}$

$$\text{elemtype}(T) = \begin{cases} \text{elemtype}(T') & \text{if } T = \textbf{type } t \textbf{ is } \overline{M}\, T' \\ \tau & \text{if } T = \mathcal{C}\, \tau \\ !\, T & \text{otherwise} \end{cases}$$

$\boxed{\text{modifiers}(\overline{T_V}, T) = \overline{M}}$ **Type Modifiers**

$$\text{modifiers}(\overline{T_V}, T) = \begin{cases} \overline{M} & \text{if } T = \textbf{type } t \textbf{ is } \overline{M}\, T' \\ \overline{M} & \text{if } (T \textbf{ is } \overline{M}) \in \overline{T_V} \\ \emptyset & \text{otherwise} \end{cases}$$

$\boxed{\text{demote}(\tau) = \sigma}$ $\boxed{\text{demote}_*(T_1) = T_2}$ **Type Demotion** demote and demote$_*$ take a type and "strip" all the asset modifiers from it, as well as unfolding named type definitions. This process is useful, because it allows selecting asset types without actually having a value of the desired asset type. Note that demoting a transformer type changes nothing. This is because a transformer is **never** an asset, regardless of the types that it operators on, because it has no storage.

$$\text{demote}(\mathcal{Q}\, T) = \mathcal{Q}\, \text{demote}_*(T)$$
$$\text{demote}_*(\textbf{bool}) = \textbf{bool}$$
$$\text{demote}_*(\textbf{nat}) = \textbf{nat}$$
$$\text{demote}_*(\{\overline{x : \tau}\}) = \left\{\overline{x : \text{demote}(\tau)}\right\}$$
$$\text{demote}_*(\textbf{type } t \textbf{ is } \overline{M}\, T) = \text{demote}_*(T)$$

$\boxed{\text{fields}(T) = \overline{x : \tau}}$ **Fields**

$$\text{fields}(T) = \begin{cases} \overline{x : \tau} & \text{if } T = \{\overline{x : \tau}\} \\ \text{fields}(T) & \text{if } T = \textbf{type } t \textbf{ is } \overline{M}\, T \\ \emptyset & \text{otherwise} \end{cases}$$

$\boxed{\text{update}(\Gamma, x, \tau)}$ **Type environment modification**

$$\text{update}(\Gamma, x, \tau) = \begin{cases} \Delta, x : \tau & \text{if } \Gamma = \Delta, x : \sigma \\ \Gamma & \text{otherwise} \end{cases}$$

$\boxed{\text{compat}(n, m, \mathcal{Q})}$ The relation compat$(n, m, \mathcal{Q})$ holds when the number of values sent, n, is compatible with the original number of values m, and the type quantity used, $\mathcal{Q}$.

$$
\begin{aligned}
\text{compat}(n, m, \mathcal{Q}) \Leftrightarrow &(\mathcal{Q} = \texttt{nonempty} \text{ and } n \geq 1) \text{ or} \\
&(\mathcal{Q} = \texttt{!} \text{ and } n = 1) \text{ or} \\
&(\mathcal{Q} = \texttt{empty} \text{ and } n = 0) \text{ or} \\
&(\mathcal{Q} = \texttt{every} \text{ and } n = m) \text{ or} \\
&\mathcal{Q} = \texttt{any}
\end{aligned}
$$

$\boxed{\text{values}(T) = \mathcal{V}}$ The function values gives a list of all of the values of a given base type.

$$
\begin{aligned}
\text{values}(\texttt{bool}) &= [\texttt{true}, \texttt{false}] \\
\text{values}(\texttt{nat}) &= [0, 1, 2, \ldots] \\
\text{values}(\texttt{list } T) &= [L \mid L \subseteq \text{values}(T), |L| < \infty] \\
\text{values}(\texttt{type } t \texttt{ is } \overline{M} \; T) &= \text{values}(T) \\
